## 1 Introduction

This report documents how the Nagra/PSI Chemical Thermodynamic Data Base 01/01 (Nagra/PSI TDB 01/01, [2002HUM/BER] ) was adjusted in order to use it as a built-in default database for the GEM-Selektor (V.2-PSI) geochemical modeling code (both database and modeling code are available for download at <http://les.web.psi.ch/Software/GEMS-PSI>), referred to as GEMS below. The resulting version of the database is called Nagra/PSI TDB 01/01 GEMS.

The original Nagra/PSI TDB 01/01 was designed to be used with geochemical modeling codes that apply the **law of mass action (LMA) algorithm**. The essential thermodynamic data at 1 bar and 25°C are equilibrium constants ( $\log_{10}K^\circ$ ) for the formation reactions of product species, which comprise aqueous product species, solids, and gases. Each formation reaction involves a single product species which is related to at least one of the aqueous master species. Two types of such master species can be distinguished: The *primary master species* are the basic building blocks for setting up reactions, while the *secondary master species* themselves are related to *primary master species* by means of formation reactions. In addition, the Nagra/PSI TDB 01/01 also contains data for chemical elements.

With this database structure, the minimal dataset required to calculate geochemical equilibria at 1 bar and 25°C consists of a  $\log_{10}K^\circ$  for the formation reaction of each secondary master species and of each product species, whereas no thermodynamic data are required for the primary master species.

GEMS is a geochemical modeling code based on a **Gibbs energy minimization (GEM) algorithm**. The essential thermodynamic data are Gibbs energies of formation from the elements ( $\Delta_f G^\circ$ ) for each chemical entity (aqueous species, solid, and gas) available in the GEMS database. There are two kinds of record formats for chemical entities: DComp format contains "directly provided" standard-state molar thermodynamic properties such as  $\Delta_f G^\circ$ ,  $S^\circ$ ,  $C_p^\circ$ , and  $V^\circ$  (at  $P_\circ$ ,  $T_\circ$ ), plus necessary parameters for temperature/pressure corrections. ReacDC format defines  $\Delta_f G^\circ$ ,  $S^\circ$ , etc. of a chemical entity through  $\log_{10}K^\circ$  (or  $\Delta_r G^\circ$ ),  $\Delta_r S^\circ$ ,  $\Delta_r C_p^\circ$ , and  $\Delta_r V^\circ$  of a reaction and standard molar properties of other entities involved in the reaction.

The main task in porting the Nagra/PSI TDB 01/01 to GEMS was to derive  $\Delta_f G^\circ$  of each aqueous species, solid, and gas from its formation constant and from  $\Delta_f G^\circ$  of the master species taking part in the corresponding formation reaction. Thus, any  $\log_{10}K^\circ$  contained in the Nagra/PSI TDB 01/01 is perfectly reproducible at 1 bar and 25°C by using the appropriate values of  $\Delta_f G^\circ$  derived in this report and listed in Table A1 in the Appendix.

In addition to these  $\Delta_f G^\circ$  and  $\log_{10}K^\circ$  data, the Nagra/PSI TDB 01/01 GEMS also includes some data for the extrapolation of  $\Delta_f G^\circ$  and  $\log_{10}K^\circ$  to temperatures above 25°C. The revised HKF (Helgeson-Kirkham-Flowers) equation of state [1988TAN/HEL] is used for calculating the change in the partial molal Gibbs energy of aqueous species as a function of pressure and temperature. [1988TAN/HEL], [1995HAA/SHO], [1995POK/HEL], [1997SHO/SAS], [1997SHO/SAS2], [1997SVE/SHO], [1998SAS/SHO] and [1999MUR/SHO] published HKF parameters for numerous aqueous species. We decided to adopt these parameters, if available, for aqueous species in the Nagra/PSI TDB 01/01 GEMS. Thus, the corresponding DComp records contain  $\Delta_f G^\circ$ , as derived from the Nagra/PSI TDB 01/01, and the HKF parameters taken from the sources listed above. Note that these parameters were adopted without a critical evaluation.

If HKF parameters were not available, reaction properties allowing temperature extrapolations like  $\Delta_r H^\circ$ ,  $\Delta_r S^\circ$ , or  $\Delta_r C_p^\circ$  were taken from the Nagra/PSI TDB 01/01, together with  $\log_{10} K^\circ$ , and stored in ReacDC records.

**Note:** The Nagra/PSI TDB 01/01 GEMS contains numerous thermodynamic data that were taken from the literature without being critically reviewed. The only data that have gone through a thorough review and evaluation process (as described in [2002HUM/BER]) are (1) the  $\log_{10} K^\circ$  values directly taken from the Nagra/PSI TDB 01/01 for ReacDC records and (2) the  $\Delta_f G^\circ$  values for DComp records of secondary master species and product species, which were all derived from reviewed  $\log_{10} K^\circ$  values taken from the Nagra/PSI TDB 01/01. Note, however, that the derived values for  $\Delta_f G^\circ$  depend upon the choice of  $\Delta_f G^\circ$  for the primary master species (which have not been reviewed by us).

## 2 Basic Procedure

The Nagra/PSI TDB 01/01 was ported to GEMS in five steps.

1. **Atomic weights,  $S^\circ$  and  $C_p^\circ$  for the elements:** The Nagra/PSI TDB 01/01 contains atomic weights, standard molar third-law entropies  $S^\circ$  and standard molar heat capacities  $C_p^\circ$  for the elements. All values for  $S^\circ$  and  $C_p^\circ$  were adopted for GEMS. Some of the atomic weights were slightly adjusted to conform to the IUPAC recommendations [1999IUPAC]. In addition, values for  $C_p^\circ$  that are missing in the Nagra/PSI TDB 01/01 were added.
2.  **$\Delta_f G^\circ$  and  $S^\circ$  for the *primary master species*<sup>1</sup>:** For most of the *primary master species* data for  $\Delta_f G^\circ$  and  $S^\circ$  were selected not from the Nagra/PSI TDB 01/01 but from other sources. This is perfectly permissible, since the primary purpose of the Nagra/PSI TDB 01/01 GEMS is to reproduce the  $\log_{10} K^\circ$  from the Nagra/PSI TDB 01/01.
3.  **$\Delta_f G^\circ$  and  $S^\circ$  for the *secondary master species*:** Values of  $\Delta_f G^\circ$  for the *secondary master species* were calculated from the  $\log_{10} K^\circ$  values of the Nagra/PSI TDB 01/01 and the values derived in step 2 for  $\Delta_f G^\circ$  of the corresponding *primary master species*. Thus the values of  $\log_{10} K^\circ$  listed in the Nagra/PSI TDB 01/01 for the *secondary master species* can be faithfully reproduced with the appropriate  $\Delta_f G^\circ$  values given in this report. Values for  $S^\circ$  were selected from other sources, as they are relevant for temperature corrections only.
4.  **$\Delta_f G^\circ$  for *product species*:** Values of  $\Delta_f G^\circ$  for the *product species* were calculated from the  $\log_{10} K^\circ$  values of the Nagra/PSI TDB 01/01 and from the values derived in step 2 and step 3 for  $\Delta_f G^\circ$  of the corresponding *primary* and *secondary master species*. These calculations, as well as those in step 3, were carried out with the database management program PMATCHC [2001PEA/THO].
5. **Additional thermodynamic data:** For the charged aqueous species, extended Debye-Hückel or WATEQ a parameters and WATEQ b parameters were adopted from the Nagra/PSI TDB 01/01. These data, together with the  $\Delta_f G^\circ$  values derived in steps 2 to 4

---

<sup>1</sup> The GEMS database structure does not distinguish between master species and product species, only between independent components (IC) and dependent components (DC). IC are the chemical elements and DC comprise aqueous species, solids, and gases. In the following, *primary master species*, *secondary master species*, and (*aqueous*) *product species* are written in italics, as a reminder that they refer to the Nagra/PSI TDB 01/01 database structure.

are sufficient to calculate thermodynamic equilibria at standard pressure and temperature. Additional data are needed for calculations at elevated pressures and temperatures. These were added, if available, in the last step. However, the quality of these data was not reviewed.

The data records of Nagra/PSI TDB 01/01 GEMS are distributed among several GEMS database files. Their organization is shown in Table 1.

## 2.1 Thermodynamic Data for the Elements

The selected values for the atomic weights,  $S^\circ$ , and  $C_p^\circ$  of the elements are listed in Table 2.  $S^\circ$  and  $C_p^\circ$  were adopted from the Nagra/PSI TDB 01/01. The atomic weights were also taken from the Nagra/PSI TDB 01/01, but some of them were slightly adjusted to conform to the IUPAC recommendations [1999IUPAC]. In addition, values for  $C_p^\circ$  that are missing in the Nagra/PSI TDB 01/01 were selected. This concerns Am(cr), Ba(cr), Eu(cr), Ni(cr), Ra(cr), Sn(cr), Sr(cr), Th(cr), and Zr(cr).

## 2.2 Thermodynamic Data for *Primary Master Species*

The values for  $\Delta_f G^\circ$  and  $S^\circ$  were selected independently from the Nagra/PSI TDB 01/01. They are listed in Table 3. Most of the values were taken from [1997SHO/SAS], the sources are indicated in Table A2 (see Appendix).

$\Delta_f G^\circ$  values were found for all *primary master species*, except for Sn(OH)<sub>4</sub>(aq).

For further calculations with the database management program PMATCHC, the database backup file AUG20\_GEMS.BAC was prepared, which is identical with AUG20.BAC, the backup file representing the Nagra/PSI TDB 01/01, except for the values of  $\Delta_f G^\circ$  and  $S^\circ$  of the *primary master species*, which are replaced by those given in Table 3.

In Nagra/PSI TDB 01/01 GEMS the *primary master species* Si(OH)<sub>4</sub>(aq) and Sn(OH)<sub>4</sub>(aq) are formulated in non-conventional form as SiO<sub>2</sub>(aq) and SnO<sub>2</sub>(aq), resp., see the discussion in Chapter 3.

All *primary master species* are kept in GEMS DComp records. Note that GEMS calculations do not require the electron as a separate species, which is therefore not included in Nagra/PSI TDB 01/01 GEMS.

**Table 1:** Organization of Nagra/PSI TDB 01/01 GEMS database files. \* stands for pdb or ndx.

\* Atomic weight of longest-lived radionuclide \*\* Atomic weight of characteristic terrestrial isotopic composition

\*\*\* Nagra/PSI TDB 01/01 GEMS has two entries for elemental nitrogen (thermodynamically identical), see Chapter 8

### 2.3 Thermodynamic Data for *Secondary Master Species*

The values for  $S^\circ$  were selected independently from the Nagra/PSI TDB 01/01. They are listed in Table 3. Most of the values were taken from [1997SHO/SAS], the sources are indicated in Table A2 (see Appendix). No values could be found for  $\text{H}_2\text{Se}(\text{aq})$ ,  $\text{I}_2(\text{aq})$ , and for  $\text{TcO}(\text{OH})_2(\text{aq})$ .

Values for  $\Delta_f G^\circ$  were calculated with PMATCHC from AUG20\_GEMS.BAC. Data used were  $\log_{10} K^\circ$  for the formation reactions of *secondary master species* (from Nagra/PSI TDB 01/01) and  $\Delta_f G^\circ$  of the corresponding *primary master species* (from Table 3).

The *secondary master species*  $\text{Al}(\text{OH})_4^-$ ,  $\text{SiO}(\text{OH})_3^-$ , and  $\text{SiO}_2(\text{OH})_2^{2-}$  are given in non-conventional form as  $\text{AlO}_2^-$ ,  $\text{HSiO}_3^-$ , and  $\text{SiO}_3^{2-}$ , resp., see the discussion in Chapter 3. The derivation of thermodynamic data for these species is described in Chapter 5.

All *secondary master species* are kept in GEMS DComp records, with the exception of  $\text{SiO}_2(\text{OH})_2^{2-}$  (equivalent to  $\text{SiO}_3^{2-}$ ), which is kept in a ReacDC record.

### 2.4 Thermodynamic Data for *Product Species*

Thermodynamic data for *product species* in Nagra/PSI TDB 01/01 GEMS are stored in ReacDC and DComp records.

For ReacDC records,  $\log_{10} K^\circ$  values were taken directly from Nagra/PSI TDB 01/01. For DComp records,  $\Delta_f G^\circ$  values were calculated with PMATCHC from AUG20\_GEMS.BAC as described above for *secondary master species*.

For a small number of *product species* in Nagra/PSI TDB 01/01 the original data given were values of  $\Delta_f G^\circ$  instead of  $\log_{10} K^\circ$ . These data had to be treated separately, as described in Chapter 4.

The derivation of thermodynamic data for silica *product species* is described in Chapter 5.

### 2.5 Additional Thermodynamic Data

For ReacDC records,  $\log_{10} K^\circ$  (or  $\Delta_f G^\circ$ ) values are sufficient for GEMS calculations of chemical equilibrium at 1 bar and 25°C. Additional data are needed for temperature extrapolations of  $\log_{10} K^\circ$  or  $\Delta_f G^\circ$ . Based on the data available from Nagra/PSI TDB 01/01, four types of datasets can be distinguished in Nagra/PSI TDB 01/01 GEMS:

- 1.)  $\Delta_r H^\circ$  and  $\Delta_r C_p^\circ$  are given: This is sufficient for the 3-term extrapolation.
- 2.)  $\Delta_r H^\circ$  is given and it is assumed that  $\Delta_r C_p^\circ = 0$ : This is sufficient for the 2-term extrapolation.
- 3.) No data are given and it is assumed that  $\Delta_r S^\circ = \Delta_r C_p^\circ = 0$ : This is sufficient for the 1-term extrapolation ( $\Delta_r G^\circ = \text{const.}$ ).
- 4.) No data are given and it is assumed that  $\Delta_r H^\circ = \Delta_r C_p^\circ = 0$ . This is sufficient for the 1-term extrapolation ( $\log_{10} K^\circ = \text{const.}$ ).

These temperature extrapolations (and their limitations) are discussed by [2002KUL]. The 2-term and the 1-term extrapolations can be applied with confidence only to isocoulombic and isoelectric reactions and possibly to reactions between solids and neutral species (see also Chapter 7). These extrapolations are not warranted for all other reactions and the user of the

Nagra/PSI TDB 01/01 GEMS must be aware of this when interpreting calculation results. Note that all datasets not sufficient for temperature extrapolations are marked with braces {} in Table A2 (see Appendix).

$\Delta_f G^\circ$  values from DComp records are sufficient for GEMS calculations of chemical equilibrium at 1 bar and 25°C. Additional data are needed for temperature corrections of  $\Delta_f G^\circ$ . Four types of datasets can be distinguished in Nagra/PSI TDB 01/01 GEMS:

- 1.) HKF-parameters for calculation of  $C_p^\circ(P,T)$ ,  $S^\circ$ , and other partial molal properties
- 2.)  $C_p^\circ(T)$ -functions,  $S^\circ$
- 3.)  $C_p^\circ$ ,  $S^\circ$
- 4.)  $S^\circ$

Only the first two datasets allow rigorous temperature corrections for  $\Delta_f G^\circ$ . Therefore, all datasets of type 3 and 4 are marked with braces {} in Table A2.

The additional datasets for DComp records were included into Nagra/PSI TDB 01/01 GEMS without review and are usually not compatible with the corresponding data in the Nagra/PSI TDB 01/01. The sources are given in Table A2 (see also Chapter 1). Some of the HKF-parameters were estimated using the PRONSPREP algorithm (see Chapter 6).

**Note:** The additional datasets given for the calculation of chemical equilibria at elevated temperatures should not be considered as part of the official Nagra/PSI TDB 01/01 GEMS. The reason for this is that only the ReacDC data were taken from Nagra/PSI TDB 01/01 GEMS while the datasets chosen for DComp records do not necessarily reproduce the corresponding data in the Nagra/PSI TDB 01/01.

The official data are restricted to the minimal set required for the calculation of chemical equilibria at 1 bar and 25°C. These are the  $\Delta_f G^\circ$  values for DComp records and the  $\Delta_f G^\circ$  values calculated from the  $\log_{10} K^\circ$  values of ReacDC records.

**Table 3:** Thermodynamic data selected for *primary master species* at 25°C and 1 bar. For references see Table A2.

\*\* Nagra/PSI TDB 01/01 GEMS has two entries for N<sub>2</sub>(aq) (thermodynamically identical), see Chapter 8

### 3 Non-Conventional Stoichiometry for Hydroxo Complexes

Thermodynamic data for hydroxo complexes based on the HKF equation of state (e.g., [1995HAA/SHO], [1997SHO/SAS], [1997SHO/SAS2], [1997SVE/SHO], [1998SAS/SHO], [1999MUR/SHO], and the database slop98.dat, see <http://levee.wustl.edu/geopig>) refer to a non-conventional stoichiometry of the complexes, which is obtained by subtracting the maximal number of H<sub>2</sub>O from the conventional stoichiometry. Thus, e.g., Fe(OH)<sub>2</sub><sup>+</sup> can be written as FeO<sup>+</sup>, and Fe(OH)<sub>3</sub>(aq) as FeO<sub>2</sub>H(aq), see Table 5. In order to retain temperature corrections provided by the HKF equation of state, we also adopted the non-conventional stoichiometry.

By definition, the standard molar thermodynamic properties of a non-conventional hydroxo complex are calculated from those of a conventional hydroxo complex by subtracting from the latter the corresponding standard molar thermodynamic properties of H<sub>2</sub>O(l) [1997SHO/SAS].

Therefore,  $\Delta_r G^\circ$  of a reaction relating the conventional to the non-conventional hydroxo complex is always equal to zero as, e.g., in

This is obvious from

$$\Delta_f G^\circ(\text{SnO}_2, \text{aq}) = \Delta_f G^\circ(\text{Sn(OH)}_4, \text{aq}) - 2\Delta_f G^\circ(\text{H}_2\text{O}, \text{l}) .$$

As a consequence,  $\log_{10}K^\circ$  is also equal to zero

$$\Delta_r G^\circ(1) = \log_{10}K^\circ(1) = 0 ,$$

which implies that for any reaction involving a hydroxo complex,  $\log_{10}K^\circ$  is unaffected by the choice between conventional or non-conventional stoichiometry. For example, the formation of CaSn(OH)<sub>6</sub>(s) can be expressed in terms of Sn(OH)<sub>4</sub>(aq) as

or in terms of SnO<sub>2</sub>(aq) as

Reaction (3) is obtained from reaction (2) by subtraction of reaction (1). Therefore,

$$\log_{10}K^\circ(2) = \log_{10}K^\circ(3) .$$

Non-conventional hydroxo complexes appear in the Nagra/PSI TDB 01/01 GEMS either as ReacDC or as DComp records. ReacDC records (see Table 6 for a list) were prepared by entering the formation reaction of the non-conventional complex and taking as  $\log_{10}K^\circ$  the unchanged value of the corresponding formation reaction of the conventional complex from the Nagra/PSI TDB 01/01.  $\Delta_f G^\circ$  of DComp records were calculated from  $\Delta_f G^\circ$  of conventional hydroxo complexes by subtracting  $\Delta_f G^\circ(\text{H}_2\text{O}, \text{l})$ , multiplied by an appropriate factor (see Table 7).

In the present version of the Nagra/PSI TDB 01/01 GEMS several hydroxo complexes still appear in their conventional form (see Table 8).

**Table 5:** Comparison of conventional and non-conventional compositions for hydroxo complexes. The superscript  $n\pm$  designates the charge of a complex.

| Conventional Stoichiometry        | Non-conventional Stoichiometry   | Difference in H <sub>2</sub> O |
|-----------------------------------|----------------------------------|--------------------------------|
| Me(OH) <sup>n±</sup>              | Me(OH) <sup>n±</sup>             | 0                              |
| Me(OH) <sub>2</sub> <sup>n±</sup> | MeO <sup>n±</sup>                | 1                              |
| Me(OH) <sub>3</sub> <sup>n±</sup> | MeO <sub>2</sub> H <sup>n±</sup> | 1                              |
| Me(OH) <sub>4</sub> <sup>n±</sup> | MeO <sub>2</sub> <sup>n±</sup>   | 2                              |
| Me(OH) <sub>5</sub> <sup>n±</sup> | MeO <sub>3</sub> H <sup>n±</sup> | 2                              |
| Me(OH) <sub>6</sub> <sup>n±</sup> | MeO <sub>3</sub> <sup>n±</sup>   | 3                              |

#### 4 $\Delta_f G^\circ$ vs. $\log_{10} K^\circ$ as Original Data

The original data for most of the *product species* in the Nagra/PSI TDB 01/01 are their formation constants. For a small number of *products species* (see Table 9 for a list), however, the original data are  $\Delta_f G^\circ$  values from which the formation constants were derived by means of the  $\Delta_f G^\circ$  values of the corresponding *master species*.

The  $\Delta_f G^\circ$  values of these *product species* were recalculated for inclusion into DComp records of the Nagra/PSI TDB 01/01 GEMS by taking the formation constants from the Nagra/PSI TDB 01/01 and the  $\Delta_f G^\circ$  of the *master species* from this report. In this way, the values of the formation constants from the Nagra/PSI TDB 01/01 are preserved even though the  $\Delta_f G^\circ$  values of the participating species may all be different from those given in the Nagra/PSI TDB 01/01.

For ReacDC records the formation constants were directly taken from the Nagra/PSI TDB 01/01.

#### 5 Silica Species

The Nagra/PSI TDB 01/01 contains the *primary master species*  $\text{Si(OH)}_4(\text{aq})$  and the *secondary master species*  $\text{SiO(OH)}_3^-$  and  $\text{SiO}_2(\text{OH})_2^{2-}$  for use in formation reactions of silica *product species*. In Nagra/PSI TDB 01/01 GEMS they are included in their non-conventional form as  $\text{SiO}_2(\text{aq})$ ,  $\text{HSiO}_3^-$ , and  $\text{SiO}_3^{2-}$ , respectively.

Thermodynamic data for the *secondary master species* were derived as follows:

**$\text{SiO(OH)}_3^-$  or  $\text{HSiO}_3^-$ :** The formation reaction of  $\text{SiO(OH)}_3^-$  is given in the Nagra/PSI TDB 01/01 as

**Table 9:** Product species whose original data in the Nagra/PSI TDB 01/01 are values for  $\Delta_f G^\circ$ .

| Name                           | Non-conventional<br>Stoichiometry | Record Type in<br>GEMS |
|--------------------------------|-----------------------------------|------------------------|
| <i>Aqueous Product Species</i> |                                   |                        |
| As(OH)4-                       | AsO2-                             | DComp                  |
| AsO4-3                         |                                   | DComp                  |
| H2AsO4-                        |                                   | DComp                  |
| H3AsO4                         |                                   | DComp                  |

| <i>Solids</i>                  |                                   |                        |
| Molybdate (MoO3)               |                                   | DComp                  |
| Nb2O5(cr)                      |                                   | ReacDC                 |
| NbO2(cr)                       |                                   | DComp                  |
| Tugarinovite (MoO2)            |                                   | DComp                  |
| USiO4(s)                       |                                   | ReacDC                 |

SiO<sub>2</sub>(aq) is obtained from Si(OH)<sub>4</sub>(aq) by

with

$$\log_{10}K^\circ(5) = 0 ,$$

see Chapter 4, and HSiO<sub>3</sub><sup>-</sup> is obtained from SiO(OH)<sub>3</sub><sup>-</sup> by

again with

$$\log_{10}K^\circ(6) = 0 .$$

Combining reactions (4), (5), and (6) results in

with

$$\log_{10}K^\circ(7) = \log_{10}K^\circ(4) .$$

$\Delta_f G^\circ$  for the DComp record HSiO<sub>3</sub><sup>-</sup> was therefore calculated from  $\log_{10}K^\circ(4)$  given by the Nagra/PSI TDB 01/01 and from the  $\Delta_f G^\circ$  values of the *primary master species* SiO<sub>2</sub>(aq), H<sub>2</sub>O(l), and H<sup>+</sup> given in Table 3.

**SiO<sub>2</sub>(OH)<sub>2</sub><sup>2-</sup> or SiO<sub>3</sub><sup>2-</sup>:** The formation reaction of SiO<sub>2</sub>(OH)<sub>2</sub><sup>2-</sup> is given in the Nagra/PSI TDB 01/01 as

This reaction is written with non-conventional stoichiometries as

with

$$\log_{10}K^\circ(9) = \log_{10}K^\circ(8) .$$

SiO<sub>3</sub><sup>2-</sup> is a ReacDC record with the reaction stoichiometry given by reaction (9) and the value for  $\log_{10}K^\circ(8)$  taken from the Nagra/PSI TDB 01/01.

The silica *product species* in Nagra/PSI TDB 01/01 GEMS are listed in Table 10. All aqueous *product species* are contained in ReacDC records with their non-conventional stoichiometries. Take for example CaSiO(OH)<sub>3</sub><sup>+</sup> (non-conventional: CaHSiO<sub>3</sub><sup>+</sup>): The formation reaction in the Nagra/PSI TDB 01/01 is

and in Nagra/PSI TDB 01/01 GEMS

As it has become clear by now,  $\log_{10}K^\circ$  is the same for both reactions. Thus, the values of  $\log_{10}K^\circ$  for all silica *product species* in ReacDC records can be directly taken from the corresponding reactions in the Nagra/PSI TDB 01/01.

**Table 10:** Silica Species in Nagra/PSI TDB 01/01 GEMS.

| Name  | Non-conventional<br>Stoichiometry             | Record Type in<br>GEMS |

## 6 Data Estimates with PRONSPREP

Numerous DComp records in the Nagra/PSI TDB 01/01 GEMS contain parameters of the revised HKF equation of state [1988TAN/HEL] for the calculation of  $C_P^\circ(P,T)$  and  $V^\circ(P,T)$  using SUPCRT92 subroutines [1992JOH/OEL] incorporated into the GEMS code. The sources of these parameters are listed in Table A2 (see Appendix).

Missing HKF-parameters for aqueous 1-1 to 1-4 complexes with monovalent ligands or with  $\text{SO}_4^{2-}$  and  $\text{CO}_3^{2-}$  were estimated with PRONSPREP, a program by [1997SVE/SHO] that is incorporated into the GEMS code and extended with correlations for  $\text{SO}_4^{2-}$  and  $\text{CO}_3^{2-}$  from [1997SVE/SHO]. The estimation method is based on linear correlations among HKF-parameters and standard partial molal properties at 25°C and 1 bar.

## 7 Temperature Extrapolations for Isocoulombic Reactions

In order to apply the 1-term temperature extrapolation, [2002THO/BER] derived isocoulombic reactions (as well as reactions of solids with neutral aqueous species) for various actinides and Tc by linear combination of reactions listed in the Nagra/PSI TDB 01/01. The corresponding equilibrium constants were calculated in a similar way from those in the Nagra/PSI TDB 01/01. Some of these reactions (listed in Table 11) were adopted for the Nagra/PSI TDB 01/01 GEMS.

**Table 11:** Isocoulombic reactions and reactions involving solids and neutral species taken from [2002THO/BER]. Note that non-conventional stoichiometries are used for AmSiO(OH)<sub>3+2</sub> and Pu(OH)<sub>4</sub>.

| Name in Nagra/PSI TDB 01/01              | Formation Reaction  | T-Extrapolation                                 | log <sub>10</sub> K° |
|--|---|---|----------------------|
| Am(CO <sub>3</sub> ) <sub>1.5</sub> (cr) | AmCO <sub>3</sub> <sup>+</sup> + 0.5CO <sub>2</sub> (aq) + 0.5H <sub>2</sub> O(l) ⇌ Am(CO <sub>3</sub> ) <sub>1.5</sub> (cr) + H <sup>+</sup> | 1-term isocoul.<br>(Δ <sub>r</sub> G° = const.) | 0.5595               |
| AmCO <sub>3</sub> OH(cr)                 | AmCO <sub>3</sub> <sup>+</sup> + H <sub>2</sub> O(l) ⇌ AmCO <sub>3</sub> OH(cr) + H <sup>+</sup>  | 1-term isocoul.<br>(Δ <sub>r</sub> G° = const.) | -0.60                |
| AmSiO(OH) <sub>3+2</sub>                 | AmF <sup>2+</sup> + HSiO <sub>3</sub> <sup>-</sup> ⇌ AmHSiO <sub>3</sub> <sup>2+</sup> + F <sup>-</sup>                                       | 1-term isocoul.<br>Δ <sub>r</sub> G° = const.   | 4.70                 |
| Pu(OH) <sub>4</sub>                      | Pu <sup>4+</sup> + UO <sub>2</sub> (aq) ⇌ PuO <sub>2</sub> (aq) + U <sup>4+</sup>   | 1-term isocoul.<br>(Δ <sub>r</sub> G° = const.) | 0.60                 |
| PuO <sub>2</sub> (hyd,ag)                | PuO <sub>2</sub> (aq) ⇌ PuO <sub>2</sub> (hyd,ag)   | 1-term<br>(log <sub>10</sub> K° = const.)       | 10.4*                |
| TcCO <sub>3</sub> (OH) <sub>2</sub>      | TcO(OH) <sub>2</sub> (aq) + HCO <sub>3</sub> <sup>-</sup> ⇌ TcCO <sub>3</sub> (OH) <sub>2</sub> (aq) + OH <sup>-</sup>                        | 1-term isocoul.<br>(Δ <sub>r</sub> G° = const.) | -5.029               |
| ThCO <sub>3</sub> (OH) <sub>3-</sub>     | ThO <sub>2</sub> (aq) + HCO <sub>3</sub> <sup>-</sup> + H <sub>2</sub> O(l) ⇌ ThCO <sub>3</sub> (OH) <sub>3</sub> <sup>-</sup>                | 1-term isocoul.<br>(Δ <sub>r</sub> G° = const.) | 4.971                |

\* Note that in [2002THO/BER] log<sub>10</sub>K° of this reaction is erroneously given as 6.4.

## 8 Species and Data not Contained in Nagra/PSI TDB 01/01

Nagra/PSI TDB 01/01 does not include the aqueous species Sn<sup>4+</sup> and ClO<sub>4</sub><sup>-</sup>. The reason for their inclusion into Nagra/PSI TDB 01/01 GEMS is given in the following sections, together with a discussion of their thermodynamic data.

Nitrogen is treated specially in Nagra/PSI TDB 01/01 GEMS. It is observed that nitrogen gas in the atmosphere is not in equilibrium with aqueous nitrogen in streams, lakes, or oceans [1996STU/MOR]. In order to decouple atmospheric nitrogen from aqueous nitrogen in GEMS modeling, element "Nit" (with record key Nit:a:nitrogen\_atm) was created in addition to the ordinary element "N" (N:e:nitrogen). Note that both of these have identical thermodynamic properties. "Nit" is used to define N<sub>2</sub>(g) (g:N0:N2:add) and N<sub>2</sub>(aq) (a:wN0:N2@:atm:), which are decoupled from all other nitrogen-bearing species that are defined through "N".

If for specific modeling purposes N<sub>2</sub>(g) and N<sub>2</sub>(aq) are assumed to be coupled with the other nitrogen-bearing species, they have to be defined through "N", which is the case for N<sub>2</sub>(g) with the record key (g:N0:N2:enp:) and N<sub>2</sub>(aq) with the record key (a:wN0:N2@:bnp:). Note that decoupled N<sub>2</sub>(g) is thermodynamically identical with coupled N<sub>2</sub>(g), and decoupled N<sub>2</sub>(aq) with coupled N<sub>2</sub>(aq).

### 8.1 Sn(IV)

Sn(II) and Sn(IV) are not redox coupled in the Nagra/PSI TDB 01/01 due to the lack of a reliable equilibrium constant for the reaction that links Sn<sup>2+</sup> with Sn<sup>4+</sup> (see the discussion in [2002HUM/BER]). Therefore, Sn<sup>4+</sup> is not included in the Nagra/PSI TDB 01/01 and no Δ<sub>r</sub>G° values are given for Sn(OH)<sub>4</sub>(aq), the *primary master species* for Sn(IV), and for the remaining Sn(IV) species and solids, Sn(OH)<sub>5</sub><sup>-</sup>, Sn(OH)<sub>6</sub><sup>2-</sup>, CaSn(OH)<sub>6</sub>(s), cassiterite, and SnO<sub>2</sub>(am).

**Table 12:** Thermodynamic data for Sn(IV) species and solids at 25°C and 1 bar.

| Name in<br>Nagra/PSI TDB 01/01    | $\Delta_f G^\circ$<br>[kJ/mol] | Non-conventional<br>Stoichiometry | $\Delta_f G^\circ$<br>[kJ/mol] | Record Type<br>in GEMS |

| <i>Solids</i>                     |                                |                                   |                                |                        |
| CaSn(OH) <sub>6</sub> (s)         | -1931.499                      |                                   |                                | ReacDC                 |
| Cassiterite (SnO <sub>2</sub> )   | -525.302                       |                                   |                                | DComp                  |
| SnO <sub>2</sub> (am)             | -521.306                       |                                   |                                | ReacDC                 |

Use of the Nagra/PSI TDB 01/01 with GEMS requires that a value be given for  $\Delta_f G^\circ(\text{Sn(OH)}_4, \text{aq}, 298.15)$ , otherwise it would not be possible to calculate  $\Delta_f G^\circ$  of Sn(IV) species and solids from their equilibrium constants in Nagra/PSI TDB 01/01, and they would have to be excluded from GEMS calculations.

[2002HUM/BER] provided an estimate of

$$\log_{10} K^\circ(14, 298.15) = -1.4$$

for

(note that this reaction is not part of the Nagra/PSI TDB 01/01). With this estimate,  $\Delta_f G^\circ(\text{Sn(OH)}_4, \text{aq}, 298.15)$  can be calculated from  $\Delta_f G^\circ(\text{H}^+, 298.15) = 0$ ,  $\Delta_f G^\circ(\text{H}_2\text{O}, \text{l}, 298.15)$  given in Table 1, and from  $\Delta_f G^\circ(\text{Sn}^{4+}, 298.15)$ .

For the latter, we adopted the value given by [1985BAR/PAR] without critical review

$$\Delta_f G^\circ(\text{Sn}^{4+}, 298.15) = 2.72 \text{ kJ/mol}$$

Therefore,

$$\Delta_f G^\circ(\text{Sn(OH)}_4, \text{aq}, 298.15) = -954 \text{ kJ/mol}$$

This value – based on an estimate for  $\log_{10} K^\circ(14, 298.15)$  and on an unreviewed value for  $\Delta_f G^\circ(\text{Sn}^{4+}, 298.15)$  – should be interpreted as an **arbitrary reference value**. It is only provided for the calculation of  $\Delta_f G^\circ$  (see Table 12) for Sn(IV) species and solids from their equilibrium constants listed in the Nagra/PSI TDB 01/01 and from the  $\Delta_f G^\circ$  values of the appropriate *master species* in Tables 3 and 4.

Thus, the Nagra/PSI TDB 01/01 GEMS does couple  $\text{Sn}^{4+}$  with  $\text{Sn}^{2+}$  (in contrast to the Nagra/PSI TDB 01/01). Since this coupling rests on shaky ground, calculations involving Sn must be interpreted with extreme caution, especially with respect to the redox state of Sn.

## 8.2 Perchlorate

The perchlorate ion  $\text{ClO}_4^-$  is not considered in the Nagra/PSI TDB 01/01. In order to allow the retrieval of thermodynamic data by GEMS modeling of experiments in perchlorate media, thermodynamic data by [1997SHO/SAS] for  $\text{ClO}_4^-$  are included in the Nagra/PSI TDB 01/01 GEMS.

## 9 Acknowledgments

Partial financial support by Nagra (National Cooperative for the Disposal of Radioactive Waste) is gratefully acknowledged.

**Appendix**

**Table A1:**  $\Delta_f G^\circ$  values from the Nagra/PSI TDB 01/01 GEMS. Legend to phase state in GEMS record keys: a - aqueous species, s - solid, g - gas. Syntax of chemical formulae: The formal valence of an element (if different from the default valence, see Table 2) is enclosed in vertical bars, as in Am|3|+3. Neutral aqueous species are designated by @, as in B(OH)3@. Aqueous species, solids, or gases also contained in slop98.dat (version 30. Oct. 1998) for SUPCRT 92 [1992JOH/OEL] are marked with a #-sign.

**Table A2** Sources of thermodynamic data for aqueous species, solids, and gases. Braces around thermodynamic parameters indicate that they are not sufficient for the reliable calculation of the temperature dependence of  $\log_{10}K^\circ$  or  $\Delta_f G^\circ$ .

Nagra/PSI: Nagra/PSI TDB 01/01 [2002HUM/BER]  
 Nagra/PSI\*: This work, calculated from  $\log_{10}K^\circ$  in Nagra/PSI TDB 01/01, see text for discussion  
 Nagra/PSI\*\*: [2002THO/BER], calculated from  $\log_{10}K^\circ$  in Nagra/PSI TDB 01/01, see text for discussion  
 PRONSPREP: This work, estimated with PRONSPREP according to [1997SVE/SHO]  
 slop98.dat: Datafile slop98.dat (version 30. Oct 1998) for SUPCRT92 [1992JOH/OEL]  
 SUPCRT92: Datafile sprons92.dat (version 15. Feb. 1991) for SUPCRT92 [1992JOH/OEL]
